

Example:

Find the following:

1. $f(2)$
2. $\lim_{x \rightarrow -2} f(x)$
3. $\lim_{x \rightarrow 2} f(x)$
4. $\lim_{x \rightarrow 3^+} f(x)$
5. $\lim_{x \rightarrow 3^-} f(x)$
6. $\lim_{x \rightarrow 3} f(x)$
7. $f(5)$
8. $\lim_{x \rightarrow 5^-} f(x)$
9. $f(-3)$

Definition:

A function f is **continuous at the point** $x = a$ if the following hold:

1. $f(a)$ is defined
2. $\lim_{x \rightarrow a} f(x)$ exists (that is both its one-sided limits exist and agree)
3. $\lim_{x \rightarrow a} f(x) = f(a)$

Question: At what point(s) is the function above discontinuous?

Notes:

1. Constant functions and polynomial functions are continuous everywhere.
2. Rational functions $R(x) = \frac{f(x)}{g(x)}$, with f and g polynomials are continuous except where $g(x) = 0$.
3. If two functions f and g are continuous at a point a , then so are: $f \pm g$, fg , and $\frac{f}{g}$ (provided $g(a) \neq 0$).
