

## Antiderivatives and Integration

### A. Antiderivatives

A function  $F$  is an **antiderivative** of  $f$  if  $F'(x) = f(x)$ .

**Example:**  $F(x) = x^3$  is an antiderivative of  $f(x) = 3x^2$ , since  $F'(x) = 3x^2 = f(x)$ .

**Note:** If  $F(x)$  is an antiderivative of  $f$ , then so is  $F(x) + C$  for any constant  $C$ .

### B. Indefinite Integrals

The notation  $\int f(x) dx = F(x) + C$  is used to denote the indefinite integral of the function  $f(x)$  with respect to the variable  $x$ . Here,  $F(x) + C$  is the general antiderivative of  $f(x)$ .

### C. Integration Rules

1. Integrating a constant:  $\int a dx = ax + C$  for any constant  $a$ .

$$\text{Example: } \int \frac{3}{2} dx = \frac{3}{2}x + C$$

2. Integrating Power Functions:  $\int x^r dx = \frac{1}{r+1}x^{r+1} + C$

$$\text{Example: } \int x^{\frac{3}{2}} dx = \frac{2}{5}x^{\frac{5}{2}} + C$$

3. Constant Multiples:  $\int af(x) dx = a \int f(x) dx$  for any constant  $a$ .

$$\text{Example: } \int 7x^{\frac{3}{2}} dx = 7 \int x^{\frac{3}{2}} dx = (7)\frac{2}{5}x^{\frac{5}{2}} + C = \frac{14}{5}x^{\frac{5}{2}} + C$$

4. Sums and Differences:  $\int f(x) + g(x) dx = \int f(x) dx + \int g(x) dx$ ,

$$\text{and } \int f(x) - g(x) dx = \int f(x) dx - \int g(x) dx \text{ for any functions } f \text{ and } g.$$

$$\text{Example: } \int 3x^2 + x^{\frac{3}{2}} dx = \int 3x^2 dx + \int x^{\frac{3}{2}} dx = x^3 + \frac{2}{5}x^{\frac{5}{2}} + C$$

5. Integrals Resulting in Exponentials and Natural Logarithms:

$$\int e^x dx = e^x + C, \text{ and } \int \frac{1}{x} dx = \ln|x| + C.$$

### D. An Initial Value Problem

Suppose  $f'(x) = 5x^2 - 4x + 7$  and  $f(1) = 5$ . Find  $f(x)$ .

Antidifferentiating,  $f(x) = \frac{5}{3}x^3 - 2x^2 + 7x + C$ .

Then  $f(1) = 5 = \frac{5}{3}(1)^3 - 2(1)^2 + 7(1) + C = \frac{5}{3} - 2 + 7 + C$

Therefore,  $5 - \frac{5}{3} - 5 = C$ , so  $C = -\frac{5}{3}$ .

Hence  $f(x) = \frac{5}{3}x^3 - 2x^2 + 7x - \frac{5}{3}$ .

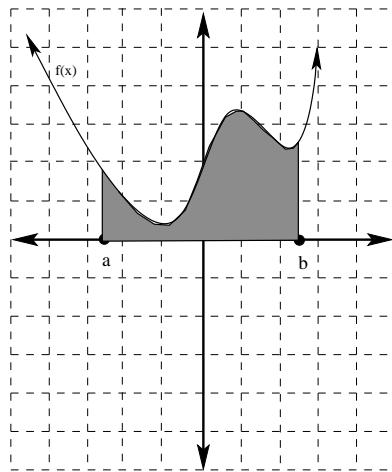

## E. Definite Integrals

### The Fundamental Theorem of Calculus:

Let  $f$  be a continuous function on the interval  $[a, b]$ , and let  $F$  be an antiderivative of  $f$ .

$$\text{Then } \int_a^b f(x) dx = F(b) - F(a)$$

**Note:** The number resulting from this computation is the area "under" the graph of  $f(x)$  between  $x = a$  and  $x = b$ .

$$\text{Example: } \int_1^3 3x^2 dx = x^3 \Big|_1^3 = 3^3 - 1^3 = 27 - 1 = 26$$

## F. Properties of Definite Integrals

1.  $\int_a^a f(x) dx = 0$
2.  $\int_a^b f(x) dx = - \int_b^a f(x) dx$
3.  $\int_a^b cf(x) dx = c \int_a^b f(x) dx$ , for any constant  $c$
4.  $\int_a^b f(x) \pm g(x) dx = \int_a^b f(x) dx \pm \int_a^b g(x) dx$
5.  $\int_a^b f(x) dx = \int_a^c f(x) dx + \int_c^b f(x) dx$ , for any  $a < c < b$

## G. The Average Value of a Function

Let  $f$  be a function that is integrable on an interval  $[a, b]$ . Then the **average value** of  $f$  over  $[a, b]$  is  $\frac{1}{b-a} \int_a^b f(x) dx$ .
