- Assume the given graph is the derivative, f', of a continuous function f. 1.
 - (a) Identify the critical numbers for *f*.
 - (b) At what value(s) of x is f'' zero?
 - (c) On what intervals is f concave upward. Explain.
- (d) On what intervals is f concave downward. Explain.
- (e) At what value(s) of x does f have a local (f) At what value(s) of x does f have a local maximum? Explain.
- (g) Does *f* have a critical number at which no local extremum occurs? Explain.
- minimum? Explain.
- (h) At what value(s) of x does f have an inflection point? Explain.

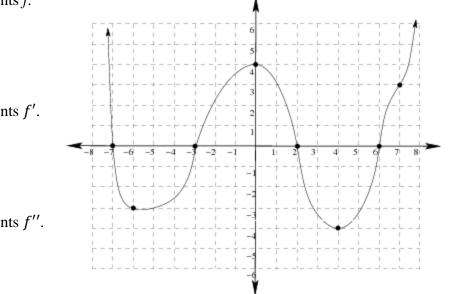

Given that a function g is increasing and concave down, g(0) = 1 and g(10) = 7, what can be said 2. about g(5)? In particular, what is the best lower bound that can be found for g(5)?

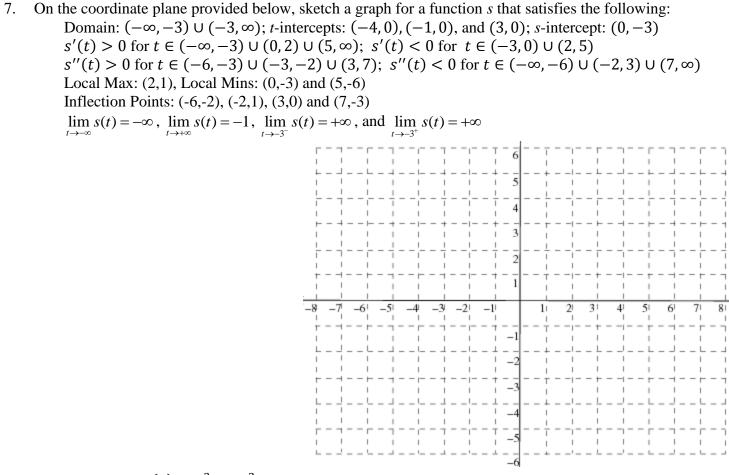

- 3. Consider the graph below. Determine the intervals where g is concave up and concave down. Also, find the *x*-coordinates of any inflection points.
 - (a) Assume the graph shown represents f.
 - (b) Assume the graph shown represents f'.
 - (c) Assume the graph shown represents f''.
- 4. Determine whether the described function has a local extrema. If it has an extrema, classify it.
 (a) Three is a critical number of g and g''(3) = 2.
 (b) The velocity of a particle is 0 at 8 seconds and the acceleration is negative at 8 seconds.

(c)
$$f'(3) = 1$$
 and $f''(3) = 0$

- (d) R'(2) = 0 and *R* changes from increasing to decreasing at 2.
- 5. Let P(t) represent the share price of a stock at a time t. What do each of the following statements tell us about the signs of the first and second derivatives of P.
 - (a) The price of the stock is rising faster (b) The price of the stock is close to bottoming out. and faster.

8. For the function $g(x) = x^3 - 3x^2$, find the *x*-intercepts and y-intercept, any asymptotes, the intervals where it is increasing, decreasing, concave up, or concave down. Find all local extrema and inflection points. Then sketch the function on the grid provided.
