JASPERSE CHEM 350 TEST 1 VERSION 1 Organic Chemistry I - Jasperse
Intro and Review
Structure and Properties of Organic Molecules
Structure, Nomenclature, and Conformation/Stereochemistry of Alkanes

1. Draw the correct Lewis structure of CH₃CN. (Needn't show 3-D geometry) (3pt)

1. Want normal bonding for all
2. C=O (or C=C in other cases) may help
3. If you have any formal charges (not here), they must sum to net charge of molecule (zero, in this case)
4. Organization must match condensed formula sequence

Metal \Rightarrow formal charge

2. Draw the correct Lewis structure for HOCH₂CHO. (Needn't show 3-D geometry). (3pt)

3. Draw a 3-dimensional picture for the atoms in CH₃CO₂CH₂NHCH₃, using the hash-wedge convention. (You needn't specify lone pairs, and orbitals need not be shown). (5pt)

1. The Nitrogen is tetrahedral, so the N-H hydrogen must either be wedged or hashed. (The lone pair doesn't need to be drawn in, but it impacts the shape of the nitrogen)
2. Drawing the correct Lewis structure is essential! Do first!

Fine if N-H is hashed instead of wedged

4. For the structure shown, what is the hybridization, electron-pair geometry, and approximate bond angle (90, 109, 120, or 180) relative to: (6pt)

	hybridization	electron-pair geometry	bond angle	hybridization	electron-pair geometry	bond angle
O-1	sp^3	tetrahedral	$\sim 109^\circ$	C-5	sp^2	trig planar 120
C-2	sp^3	tet	109	N-7	sp^3	tet 109
C-3	sp^2	trigonal planar	120	O-9	sp^2	trig planar 120

5. Assign any formal charges to any appropriate atoms for proline, given the structure shown (one of the body's 20 monomers from which protein and enzyme biopolymers are constructed). (3pt)

Normal

C 4
N 3
O 2

Ox 3 bonds \Rightarrow +
1 \rightarrow -
N 4

6

6. Rank the acidity of the following, from 1 (most) to 4 (least). (4pt)

Think
Anion/
base

3 Acidity Factors:

1. charge (not relevant here)
2. Energ
3. Resonance

7. Which of the following represent pairs of resonance structures? (4pt)

d. Both a and c

e. a, b, and c are all resonance structures.

8. Draw arrows to show electron-movement in the following two steps (draw arrows for each step).

(5pt)

Explain change in:

1. Bonds
2. Charge
3. Lone Pairs

9. Rank the series on the basis of boiling point, 1 having highest boiling point, 3 having lowest. (3pt)

H-bonding No
Polar Yes

H-bonding No
Non-polar

H-bonding Yes

3 factors:

1. H-bonding
2. London force (# of carbons) - both RAISE BP
3. Polar vs nonpolar

10. Rank the series on the basis of water solubility, 1 having highest solubility, 3 having lowest. (3pt)

2 factors:

1. H-bonding (raises solubility)
2. London force (# of carbons) - more C's reduces water solubility

11. For each of the following pairs of resonance structures, circle the one that would make a greater contribution to the actual resonance hybrid. (4pt)

2 Factors:

1. More bonds (priority)
2. Electronegativity (if bonds are equal)

12. Cyclopropane is much more "strained" than cyclopentane. Why? (Short!) (3pt)

Angle strain. Bonds are forced to be 60° , far from the ideal $\sim 109^\circ$ angle.
Note: angle strain only appears in certain rings;
For acyclics, steric and torsional are the only strains available.

13. For the following acid-base reaction,

a. put a box around the weakest base in the reaction

b. put a circle around the weakest acid

c. draw an arrow to show whether the equilibrium goes to the right or left. (4pt)

Base Stability factors:

1. charge
2. eneg
3. resonance

1. Equilibrium favors the more stable base
2. More stable base is "weaker" base
3. "Weaker" acid + base on same side

14. Classify the relationship between the pairs of molecules as either: (8pt)

same compound

structural isomers

resonance structures

geometric isomers

not isomers (different molecular formulas)

stereo double bond
Can't rotate

15. Give the name for the following. (7pt)

1. cis/trans for di-subbed rings
2. Alphabetize substituents
3. Numbering
4. Know isopropyl and t-butyl

cis-1-isopropyl-3-methylcyclohexane

1. Longest chain
2. Alphabetize substituents
3. Number from end near substituent

4-ethyl-3-methylheptane

16. Identify all the functional groups in the following molecules. (Do not include "alkane", since that isn't "functional".) (6pt)

17. Which of the following pair will have the larger rotation barrier, relative to the bonds indicated? (3pt)

steric reasons
in totally eclipsed

18. For the following Newman projections, rank them in stability from 1 to 4, 1 being most stable. Identify the "anti" conformation, the "gauche" conformation, and the "totally eclipsed" conformation. (6pt)

19. Draw the Newman projection for the most stable conformation of 1,2-dichloroethane. (3pt)

20. Draw the two chair conformations of cis-1-ethyl-4-methylcyclohexane. (You don't have to draw all the hydrogens). (5pt)

1. Make sure you've really drawn "flipped" chairs
2. What's "ax" in one chair flip is "eq" in the other.
3. Process cis-trans
4. Draw in H's on substituted carbons (easier to see ax/eq).

21. Which is more stable, cis- or trans-1-t-butyl-2-methylcyclohexane? Draw the best conformation of the more stable isomer. (4pt)

1. More stable chair has both substituents equatorial
2. Process cis-trans

22. Draw as many structural isomers as you can for C₆H₁₄. Be careful not to draw the same isomer twice! I will take off points for duplicating! (6pt)

alkanes

acyclic
alkane

Alkane Acyclic: C_nH_{2n+2}
Alkane Cyclic: C_nH_{2n}

Beware of drawing same thing twice!

JASPERSE CHEM 350 **TEST 1** **VERSION 2** Organic Chemistry I - Jasperse
Intro and Review
Structure and Properties of Organic Molecules
Structure, Nomenclature, and Conformation/Stereochemistry of Alkanes

1. Draw the correct Lewis structure of $\text{CH}_3\text{CO}_2\text{CH}_2\text{COCH}_3$. (Needn't show 3-D geometry) (3pt)

normal bonding

1. Want normal bonding for all
2. C=O (or C=C in other cases) may help
3. If you have any formal charges (not here), they must sum to net charge of molecule (zero, in this case)
4. Organization must match condensed formula sequence

2. Draw a 3-dimensional picture for the atoms in $\text{CH}_3\text{CH}_2\text{CHCHCH}_2\text{NHCH}_2\text{CHO}$, using the hash-wedge convention. (You needn't specify lone pairs, and orbitals need not be shown). (5pt)

1. The Nitrogen is tetrahedral, so the N-H hydrogen must either be wedged or hashed. (The lone pair doesn't need to be drawn in, but it impacts the shape of the nitrogen)
2. Drawing the correct Lewis structure is essential! Do first!

3. For the structure shown, what is the hybridization, electron-pair geometry, and approximate bond angle (90, 109, 120, or 180) relative to: (7pt, 2 points off for each error)

	hybridization	electron-pair geometry	bond angle		hybridization	electron-pair geometry	bond angle
C-1	sp^3	tetrahedral	109°	C-4	sp^2	trig planar	120
O-2	sp^3	tetrahedral	109°	N-5	sp^3	tet	109
C-3	sp^2	trigonal planar	120	C-6	sp^2	trig	120

4. Assign any formal charges to any appropriate atoms for the structure shown below. (4pt)

Ox 2
N 3
C 4

5. Rank the acidity of the following, from 1 (most) to 4 (least). (4pt)

3 Acidity Factors:

1. charge (not relevant here)
2. Eneg
3. Resonance

6. For the following pairs, identify as "isomers" ("I") or "resonance structures" ("R"). (6pt)

No atoms can move!

7. Draw arrows to show electron-movement in the following reactions. (These are reactions, not resonance.) (5pt)

Explain change in:

1. Bonds
2. Charge
3. Lone Pairs

8. Rank the series on the basis of boiling point, 1 having highest boiling point, 3 having lowest. (3pt)

2 factors:

1. H-bonding
 2. London force (# of carbons)
- both RAISE BP

9. Rank the series on the basis of water solubility, 1 having highest solubility, 3 having lowest. (3pt)

2 factors:

1. H-bonding (raises solubility)
 2. London force (# of carbons)
- more C's reduces water solubility

Alkane Acyclic: C_nH_{2n+2} Alkane Cyclic: C_nH_{2n} Alkene: C_nH_{2n} (not expected to remember, but evident if you count)

Counting H's can always double-check on this!

10. Circle whichever of the following could fit the formula C_5H_{10} ? (3pt)Acyclic alkane
 C_nH_{2n+2} Ring Alkane
 C_nH_{2n} 11. For the following acid-base reaction, *more stable*

a. put a box around the weakest base in the reaction

b. put a circle around the weakest acid

c. draw an arrow to show whether the equilibrium goes to the right or left. (4pt)

Base Stability factors:

1. charge
2. eneg
3. resonance

1. Equilibrium favors the more stable base
2. More stable base is "weaker" base
3. "Weaker" acid + base on same side

12. Classify the relationship between each pair of molecules as either: (10 pt)

same compound
stereoisomers

structural isomers

resonance structures

structural

stereo

structural

14. Give the name for the following. (7pt)

1. cis/trans for di-subbed rings
2. Alphabetize substituents
3. Numbering
4. Know isopropyl and t-butyl

trans-1-butyl-3-isopropylcyclopentane

1. Longest chain
2. Alphabetize substituents
3. Number from end near substituent

5-ethyl-3-methyloctane

X

16. Identify and write down the names for each of the functional groups in each of the following molecules. (Do not include "alkane", since that isn't "functional".) For each molecule, try to write the names in order, as they appear from left-to-right in the molecules. (8pt)

17. Circle which of the following pair will have the larger rotation barrier, relative to the bonds indicated? (2pt) Identify which reason explains why: steric strain, torsional strain, or angle strain?

← larger attachment

steric strain

Greater steric strain when totally eclipsed.
(Both will have equal torsional strain when totally eclipsed.)

18. For the following Newman projections: (6pt total)

a. rank them in stability from 1 to 4, 1 being most stable

b. identify the "anti", "gauche", and the "totally eclipsed" conformations.

anti ①

totally eclipsed ④

gauche ②

③

c. Is the energy difference between the gauche and the anti conformation based on steric strain, torsional strain, or angle strain?

d. In the case of ethane (not shown), staggered conformations are better than eclipsed conformations. Is the difference based on steric strain, torsional strain, or angle strain?

19. Draw both the most stable and the least stable Newman projections for 1-bromopropane, $\text{BrCH}_2\text{CH}_2\text{CH}_3$, relative to C1-C2 bond. - (3pt)

Best: staggered and "anti"

Worst: Totally eclipsed

20. Which of the following are correct Lewis structures, including formal charges, for nitric acid, HNO_3 . (3 pts)

- a. A only
b. B only
c. C only
d. Both A and C
e. All of the above

1. Do not exceed octet
2. If formal charges, must sum to net charge
3. As much "normal bonding" as possible, given the above constraints.

22. Draw the **two chair conformations** of cis-1-isopropyl-4-methylcyclohexane. (You don't have to draw all the hydrogens). (5pt) (Use "iPr" as abbreviation).

1. Make sure you've really drawn "flipped" chairs
2. What's "ax" in one chair flip is "eq" in the other.
3. Process cis-trans
4. Draw in H's on substituted carbons (easier to see ax/eq).

23. Draw the **best chair conformation** of the **more stable isomer**. Which is more stable, cis- or trans-1-butyl-2-methylcyclohexane? (4pt)

⇒ **trans**

1. More stable chair has both substituents equatorial
2. Process cis-trans

24. Draw any **6** of the 9 possible structural isomers for **alkanes** with formula **C_7H_{16}** . When deciding whether to draw cyclic or acyclic alkanes, make sure that you fit the formula! Be careful not to draw the same isomer twice! I will take off points for duplicating! (You can try to show off by getting more than 6, but if you do still be sure you don't duplicate!) (6pt)

Alkane Acyclic: $\text{C}_n\text{H}_{2n+2}$

Alkane Cyclic: C_nH_{2n}

Beware of drawing same thing twice!

acyclic C_7H_{16}
cyclic would be C_7H_{14}

JASPERSE CHEM 350 TEST 1 VERSION 3 Organic Chemistry I - Jasperse
Intro and Review
Structure and Properties of Organic Molecules
Structure, Nomenclature, and Conformation/Stereochemistry of Alkanes

1. (12 points) Give the relationship between the following pairs of structures. The possible relationships are the following:

same compound structural isomers resonance structures
stereo isomers not isomers (different molecular formula)

Structural.
1,2-dibromo vs
1,3-dibromo.

1. Resonance: No atoms can move!
2. Stereo: same condensed formula
3. Structural: different condensed formula

Same.
Bond rotation around single bonds is allowed.

Structural
CH₃CHCHBr vs CH₂CHCH₂Br

Stereo Trans-cis.
Double bond can't rotate.

Same. Both are 4-methylnonane

Resonance. Electrons and charge is repositioned, but no atoms moved.

2. (8 points) Draw line-angle structures and names for 4 of the 5 structural isomers of C₆H₁₄.

Alkane Acyclic: C_nH_{2n+2}
Alkane Cyclic: C_nH_{2n}

Beware of drawing same thing twice!

2,3-dimethylbutane

3. (10 Points)

a. For the above structure, what is the hybridization and approximate bond angles (109, 120, or 180) about:

C-2 sp², ~120°, trigonal planar

C-4 sp², ~120° trig planar

C-6 sp³, ~109 tetrahedral

O-8 sp³, ~109 tetrahedral

b. In the above structure, N-1 is actually found to have 120° bond angles. (This may seem unexpected to you at this point, but we'll learn why later in the course.) What must be the hybridization of the nitrogen?

sp². Hybridization, bond angle, and electron geometry are all interlocked.
To know any one of them is to know the others.

4. (2 Points) Bond rotation around C6-C7 in the above structure has a 7 kcal/mol barrier, while rotation around the C4-C5 bond has a 70 kcal/mol barrier. Explain very briefly why it is so much harder to rotate the latter bond?

Single bond versus double bond.

A double bond has overlapping p-orbitals.

To rotate a double bond, the p-p overlap would be lost. The full pi-bond would need to break.

By contrast, no bonds are broken when you rotate around a single bond.

5. (4 points) For each of the pairs listed, circle the one with the higher boiling point.

2 factors:

1. H-bonding (raises solubility) *bp.*
2. London force (# of carbons)
-more C's reduces water solubility *rather bp*

6. (6 points) Write a Lewis structure and assign any non-zero formal charges.

1. Want normal bonding for all: in absence of metal ions
2. C=O (or C=C in other cases) may help
3. If you have any formal charges (non-zero), they must sum to net charge of molecule (zero, in this case)
4. Organization must match condensed formula sequence

7. (5 points) a) Draw the best resonance structure for anion A, and circle the resonance structure that would make the greater contribution to the resonance hybrid.

2 Factors:

1. More bonds (priority)
2. Electronegativity (if bonds are equal)

- b. For the two resonance structures shown below, circle the resonance structure that would make the greater contribution to the resonance hybrid.

8. (6 points) Rank the acidity of the following molecules, 1 being most acidic, 4 being least acidic. Hint: draw the anions!

Think Anion

3 Acidity Factors:

1. charge (not relevant here)
2. Eneq
3. Resonance

9. (6 points) Draw a line-angle picture for all of the atoms in the molecule CH₃CH₂COCHClCH₃, including the hydrogens. Use the hash-wedge convention to indicate atoms that are not in the plane of the paper.

Cl could equally well be drawn in the hashed spot

10. (5 points) Rank the ring strain in the following, from 1(most) to 3 (least). Explain very briefly the differences in strain.

1

3

2

A: has large angle strain (60° angles, not 109° angles)

B: By taking on chair conformation, there is zero angle strain, and zero torsional (no eclipsing)

C: If it has ideal angles, then some eclipsing and torsional strain destabilizes it

11. (6 points) Which of the following are capable of cis-trans stereoisomerism? (Yes/No).

a. 3-ethyl-1,1-dimethylcyclopentane

No no cis/trans distinction

b. ~~2~~ pentene (name means a double bond is between carbons 3 and 4)

Yes cis/trans

c. 1,3-dimethylcyclohexane

Yes cis/trans

12. (9 points) Identify the functional groups in the following molecules. (Do not include "alkane", since that is not "functional". And do not specify "cyclic".)

a. $\text{H}_2\text{N}-\text{CH}_2-\text{CH}_2-\text{CH}_2-\text{CO}_2\text{H}$

("GABA: brain neurotransmit")

Amine

Carboxylic Acid

b.

Testosterone

Ketone

Alkene

Alcohol

c.

Cocaine

Ester

Arene or aromatic

Amine

Ester

13. (5 points) Give the IUPAC name for the following compounds.

1. Longest chain
2. Alphabetize substituents
3. Number from end near substituent

4-ethyl-3,6-dimethyloctane

1. cis/trans for di-subbed rings
2. Alphabetize substituents
3. Numbering
4. Know isopropyl and t-butyl

cis-3-methyl-1-propylcyclobutane

14. (8 points) a. Draw Newman projections for the totally eclipsed, the gauche, and the anti conformations of 2,5-dimethylhexane, relative to the C3-C4 bond. You may abbreviate the isopropyl groups attached to C3 and C4 as "i-Pr" for convenience.
b. Explain very briefly why the rotation barrier around the C3-C4 bond of 2,5-dimethylhexane is greater than the rotation barrier in butane.

b. Steric Strain. Larger rotation barrier because greater steric strain in total eclipse between two larger isopropyl groups compared to steric strain between two methyl groups. Torsional strain is common to both, to the difference is the difference in steric strain.

15. (8 points) a.) Draw the two chair conformations of cis-1-isopropyl-3-methylcyclohexane. (You don't need to show the H's on carbons other than 1 and 3). For convenience, you may abbreviate methyl as "Me" and isopropyl as "iPr"
b.) Circle the more stable conformation.
c) Would trans-1-isopropyl-3-methylcyclohexane be more stable or less stable than the cis isomer?

1. Make sure you've really drawn "flipped" chairs
2. What's "ax" in one chair flip is "eq" in the other.
3. Process cis-trans
4. Draw in H's on substituted carbons (easier to see ax/eq).

JASPERSE CHEM 350 TEST 1 VERSION 4 Organic Chemistry I - Jasperse
Intro and Review
Structure and Properties of Organic Molecules
Structure, Nomenclature, and Conformation/Stereochemistry of Alkanes

1. Order the following according to increasing electronegativity, 1 being highest, 4 lowest. (2pts)

N 3 F 1 O 2 C 4

2. Write Lewis structures and assign any non-zero formal charges. (3pts each)

a. $[\text{CH}_3\text{OH}_2]^+$

1. Want normal bonding for all: in absence of metal ions or overall charge
2. C=O (or C=C in other cases) may help
3. If you have any formal charges, they must sum to net charge of molecule (zero, in this case)
4. Organization must match condensed formula sequence

b. $\text{CH}_3\text{CO}_2\text{CH}_2\text{ONa}^\ominus$

c. $\text{CH}_3\text{CHCHCONH}_2$

3. For each of the following, a) draw its resonance structure, and for each pair b) circle the structure that would make the greater contribution to the resonance hybrid. (2 pts each)

2 Factors:

1. More bonds (priority)
2. Electronegativity (if bonds are equal)

4. Draw line-angle structures for 7 of the 9 structural isomers of C_7H_{16} . (5 pts)

Alkane Acyclic: $\text{C}_n\text{H}_{2n+2}$

Alkane Cyclic: C_nH_{2n}

Beware of drawing same thing twice!

5. For the following pairs of structures, identify them as either: Resonance Structures, Structural Isomers, Stereoisomers, or Same. (2 pts each)

6. Rank the acidity of the following molecules, 1 being most acidic, 4 being least acidic. (3 pts)

3 Acidity Factors:
1. charge (not relevant here)
2. Eneg
3. Resonance

- a) Put a box around the weakest base in the above reaction. (1pt)
b) Put a circle around the weakest acid in the above reaction. (1pt)
c) Draw an arrow to show whether at equilibrium the reaction will go left-to-right or right-to-left. (2pt)

8. Draw the line-angle structure for the following condensed structural formula: $(\text{CH}_3\text{CH}_2)_2\text{CO}$ (3pt)

9. a. For the above structure, what is the hybridization, electron-pair geometry, and approximate bond angles (109, 120, or 180) about: (6pt)

4	N-1	sp^3	tetrahedral	~ 109
4	C-3	sp^3	tetrahedral	~ 109
3	C-5	sp^2	trigonal planar	~ 120
2	C-8	sp	linear	~ 180

- b. Rank the length of the following bonds, 1 being shortest, 3 being longest. (2pt)

③	②	①
C2-C3	C4-C5	C8-C9
single	double	triple

10. For each of the pairs listed, circle the one with the higher boiling point (4pt)

2 factors:

1. H-bonding (raises bp + solubility)
2. London force (# of carbons) - more C's raises bp but reduces water solubility

3. Polarity

11. Draw a 3-dimensional picture for all of the atoms (hydrogens included) in the molecule $\text{CH}_3\text{CHCHCOCH}_2\text{CH}_2\text{NHCH}_3$. Your picture should use the hash-wedge convention to illustrate atoms that are not in the plane of the paper, and should reflect approximate bond angles. (5pt)

Note: N-H hydrogen is NOT in the plane. But it could be drawn hashed or wedged, either is fine.

12. Draw a 3-D picture of CH_2O showing the π bond as well as the four atoms. (3pt)

p-orbitals used to make the pi-bond are perpendicular to the plane of the atoms. So if we draw the pi-bond in the plane, the attached H's must be out of plane.

13. For the following set, rank the solubility in water, from 1 (most soluble) to 4 (least soluble). (3pt)

14. Identify the functional groups in the following molecules. (8pt)

15. Give the IUPAC name for the following compounds. (6pt)

1. Longest chain
2. Alphabetize substituents
3. Number from end near substituent

1. cis/trans for di-subbed rings
2. Alphabetize substituents
3. Numbering
4. Know isopropyl and t-butyl

16. Draw the Newman projections for the best and worst conformations of butane, and give the names for these conformations. Briefly explain what "strain factors" make the worst conformation worse than the best conformation. (6pt)

Torsional strain; any eclipsed conformation has torsional strain, repulsion between bond-pair electrons.

Steric strain: atoms are unnecessarily close, and repel each other

17. a.) Draw both chair conformations of cis-1-methyl-2-isopropylcyclohexane. Draw the substituents and H-atoms attached to carbons 1 and 2. (You don't need to show the H's on the other carbons). (4pt)
b.) Circle the more stable conformation. (1pt)

1. Make sure you've really drawn "flipped" chairs
2. What's "ax" in one chair flip is "eq" in the other.
3. Process cis-trans
4. Draw in H's on substituted carbons (easier to see ax/eq).

18. Draw the best chair conformation for 1,3-diethylcyclohexane, and identify whether it is "cis" or "trans". (3pt)

19. Use the arrow-pushing convention to show the electron-movement mechanisms for the following two reactions. (5pt)

Good mechanism must explain changes in:

1. Bonds
2. Formal Charges
3. Lone pairs

JASPERSE CHEM 350 TEST 2

VERSION 1

Ch. 4 The Study of Chemical Reactions; Ch. 5 Stereochemistry

Ch. 6 Alkyl Halides: Nucleophilic Substitution and Elimination

1. Predict the major organic product for each of the following. (3 points each)2. Show an alkyl bromide and some nucleophile that you could use to make the following by $\text{S}_\text{N}2$. (3 points)

No Good!

3. For the structure shown,

a. Draw the major elimination product formed upon treatment with $\text{H}_2\text{O}/\text{heat}$.

Zaitsev rule

E1: no problem with a cit-H

b. Draw the major elimination product formed upon treatment with $\text{CH}_3\text{CH}_2\text{ONa}$.anionic $\rightarrow \text{E}2$ not $\text{E}1$ c. Draw the major substitution product formed upon treatment with $\text{CH}_3\text{CH}_2\text{ONa}$.anionic $\Rightarrow \text{S}_\text{N}2$

Inversion

(3 points for each multiple choice question)

4. Which of the following is true regarding an S_N1 reaction?

- a. It would be faster at 25° than 50° **F** Solvent polarity factor, good for cations
- b. It would be faster in ethanol than in pentane **T**
- c. Keeping the moles of reactants constant but doubling the quantity of solvent would decrease the rate by a factor of 4. **F** $r = k[RX]$
- d. Stereochemical inversion occurs exclusively **F**

True for S_N2 not S_N1

True for S_N2 not S_N1

6. Which of the following statements is true?

- a. The rate determining step is always the last step in a reaction mechanism. **F**
- b. The stability/reactivity principle says that the more stable of two chemicals will be more reactive. **F**
- c. The reactivity/selectivity principle says that the more reactive of two chemicals will be less selective. **T** Cl^\bullet vs. Br^\bullet
- d. The activation barrier for a reaction is the difference in energy between reactants and final products. **F**

7. Which of the following statements is true about the chlorination of methane?

- a. In each propagation step a radical is produced **T** Chain reaction.
- b. 6.02×10^{23} initiation events are needed to make one mole of chloromethane **F**
- c. Most chloromethane is made by combination of a methyl radical with a chlorine radical **F**
- d. The overall chlorination of methane is strongly endothermic. **F**

8. Which of the following statements is FALSE?

- a. Optically active solutions always contain chiral molecules. **T**
- b. Two diastereomers always have identical melting points **F** enant yes, diast. no
- c. Optically inactive solutions are either racemic or else contain no chiral chemicals at all **T**
- d. A solution with 60% optical purity would have an 80/20 mix of enantiomers **T**

9. When the reactants shown undergo substitution, which of the products A-D will form? (3 points)

- a. A only
- b. B only
- c. A and B
- d. A, B, and C
- e. A, B, C, and D

SN1, cationic, racemization results, two enantiomers form.

10. Rank the reactivity of the structures shown toward the reactant(s) indicated on the left (1 being most, etc.) (3 points each)

anionic $\text{S}_\text{N}2/\text{E}2$

$1^\circ > 2^\circ > 3^\circ$
 $\text{I} > \text{Br} > \text{Cl}$

$\text{S}_\text{N}2$

nucleophiles

energy
stability

$\text{S}_\text{N}1$

11. Draw the product(s) of the following reaction. Show substitution product(s) only. (There might be some some alkene products formed as well, but don't bother drawing those.). If two enantiomers form, draw them both. (3 points)

Anionic, $\text{S}_\text{N}2$.
Inversion, results in a single enantiomer. Product would be optically active, not racemic.

12. Draw the mechanism for the following reaction, propagation steps only. (4 points)

13. Draw (3R,6R)-6-bromo-3-chloro-2-methyloctane (3 points)

14. Name the following: (3 points)

15. Classify each of the chiral carbons in the following structures as R or S (there may be more than one in a molecule). (10 points)

16. a. Classify each pair as diastereomers, enantiomers, or same. (12 points)

b. For the first structure of each pair, circle it if it is not chiral

c. For the first structure of each pair, write "meso" by it if it is meso

17a. a) Draw all the unique stereoisomers of 2,3-dichlorobutane. Cross out any duplicates.

b) Identify which is meso. c) Identify a pair that are related as diastereomers. (5 points)

18. Draw the mechanisms for the following reactions, using formal arrow pushing. Note: in some case hydrogens that are not illustrated will be involved in bond changes. You would do well to write them in at the beginning. (12 points total, 3/3/6 distribution)

JASPERSE CHEM 350 TEST 2

VERSION 2

Ch. 4 The Study of Chemical Reactions

Ch. 5 Stereochemistry

Ch. 6 Alkyl Halides: Nucleophilic Substitution and Elimination

1. Rank the reactivity of the following molecules toward $\text{Br}_2/h\nu$. (1 most, 4 least) (3 points)2. Rank the reactivity of the following molecules toward ethanol and AgNO_3 . (1 most, 4 least) (3 points)Leaving Group: $\text{I} > \text{Br} > \text{Cl}$ 3. Rank the reactivity of the following molecules toward NaOCH_3 . (1 most, 4 least) (3 points)

4. Rank the reactivity of the following toward 1-iodopropane. (1 most, 4 least) (3 points)

① anion > neutral
 ② $\text{S}^- > \text{O}^-$ ← more stable
 ③ O^- ↑ energy
 resonance

5. What is the hybridization of a carbocation? (2 points)

6. Predict the major organic product (1 major structure is all that is needed in each case) for each of the following reactions. (Minor products or inorganic side products need not be drawn.) (3 points each)

7. Draw the structures for intermediate **A** and final product **B**. (4 points)

8. Draw the product when the following substance undergoes E2 elimination. ("D" is deuterium, basically just a labelled hydrogen). If the starting material is optically active, will the product be optically active? (4 points)

9. Show an alkyl bromide and some nucleophile that you could use to make the following by S_N2 . (3 points each)

10. Draw all possible elimination products that could form from the following reactant. (5 points)

11. Which of the following would not increase the rate of an $E1$ reaction? (3 points)

- a. an increase in temperature *faster*
 b. an increase in the "activation energy" *slows*
 c. an increase in the concentration of the alkyl halide *faster* $r = k[RX]$
 d. an increase in the stability of the carbocation intermediate *faster*

12. When comparing the reaction of 2-methylpropane with either $\text{Cl}_2/h\nu$ or $\text{Br}_2/h\nu$, which of the following statements is true? (3 points)

- a. bromine is less reactive and more selective
 b. chlorine is less reactive and more selective
 c. bromine is more reactive and more selective
 d. chlorine is more reactive and more selective

↑
 more selective
 less reactive
 Br• more stable

13. Which of the following statements is true relative to reactions I-III: (3 points)

Me• slowest

2° fastest

- a. I has the smallest energy of activation and the highest energy transition state
 b. II has the smallest energy of activation and I has the lowest energy transition state
 c. III has the largest energy of activation and the highest energy transition state
 d. III has the smallest energy of activation and the lowest energy transition state

14. Classify each of the chiral carbons in the following structures as (R) or (S). (10 points)

15. a. Classify each pair of molecules as diastereomers, enantiomers, or same. (12 points)

b. Circle any molecules that are chiral

c. Write "meso" by any structures that are meso

16. Which of the following statements is true? (3 points)

a. All solutions with chiral molecules are optically active

b. All molecules with chiral carbons are chiral

c. A solution that has 50% optical purity has a 50/50 mixture of enantiomers

d. Two enantiomers always have identical boiling points

F 50/50 racemic mixtures

F meso

F

T

17. Draw (2R,3S)-2-bromo-3-chlorohexane (3 points)

1st try:

Final Answer

18. Name the following: (3 points)

19. a) Draw all unique stereoisomers of 2,4-dibromopentane. Label each with a letter, A, B, etc.. Cross out any duplicates. (8 points)
 b) Identify any that are chiral
 c) Identify any that are meso

20. a) Draw the mechanism for the following reaction. (Draw the propagation steps only.) (4 points)
 b) Is your product chiral, and if so is it optically active? (1 points)

21. a) Draw the mechanism for the following reaction. (4 points)
 b) Identify the slow step. (1 point)

JASPERSE CHEM 350 TEST 2

5. _____ /3	10. _____ /6	15. _____ /2	

1. List the following radicals in order of increasing stability (from most stable 1 to least stable 4)

2. List the following alkyl halides in order of decreasing reactivity toward $S_N1/E1$ reactions (from most reactive 1 to least reactive 4).

3. List the following alkyl halides in order of decreasing reactivity toward S_N2 reactions (from most reactive 1 to least reactive 4).

$1^\circ > 2^\circ > 3^\circ > \text{vinyl}$
 $I > Br > Cl$

4. Rank the bond strength of the following (from strongest 1 to weakest 4).

5a. Put a 1 by the reaction for which $\Delta H^\circ = E_{\text{act}}$. (E_{act} = activation energy)

b. Put a 2 by the reaction for which $E_{\text{act}} = 0$.

c. Put a 3 by the reaction for which $E_{\text{act}} > \Delta H^\circ$.

initiation
-bond breaks,
none made

termination
bond made, none broken

6. Predict the major organic product for each of the following reactions. (Minor products or inorganic side products need not be drawn.)

7. Show the Starting Alkyl Bromide which gave the following products.

8. Show an alkyl bromide and some nucleophile that you could use to make the following. (I don't care whether you specify a nucleophile just as the anion Z^- or as NaZ with a metal counterion.)

9. Optically active (R)-2-bromobutane can be converted to 2-butanol under either conditions A or conditions B. Describe the stereochemistry of the product solutions for the two different conditions.

a. Alcohol is Chiral or Achiral?

b. Optically Active or Not?

c. (R), (S), or both?

d. Reaction occurred by Inversion, Retention, or Racemization?

e. What happens to the rates if you double the concentrations of all reactants?

Conditions A S_N2

chiral
Yes (inversion)

S

Inversion

$\times 4$

Conditions B S_N1

chiral
No (racemization)
both R+S

Racemization

$\times 2$

10. Draw the major product for the following reaction. Then draw the mechanism for its formation. (Draw the propagation steps only.) Is your product chiral? (You may need to add relevant hydrogens.)

11. Draw the major product for the following reaction. Then draw the mechanism for its formation. (You may need to add relevant hydrogens.)

13. Draw the mechanism for the following reaction. (Don't worry about designating stereochem.)

14. Classify each of the chiral carbons in the following structures as (R) or (S).

15. Draw (R)-2-bromopentane

16. Draw *meso*-1,3-dichlorocyclopentane, and mark the chiral C's as (R) or (S).

17. Draw all of the different isomers of 2,3-dichlorobutane, identify each as either chiral or *meso*, and classify the relationship between each two as enantiotopic or diastereotopic. (You may use Fischer projections or zig/zag/hash/wedge pictures, as you please. (If two are the same, cross one of them off your list.)

18. Classify the pairs of molecules as diastereomers, enantiomers, or same. For the first molecule in each pair, circle it if it is chiral. For the second molecule in each pair, put a * next to each chiral C.

Ch. 4 The Study of Chemical Reactions

Ch. 5 Alkyl Halides: Nucleophilic Substitution and Elimination

Ch. 6 Stereochemistry

1. Draw the mechanism for the following reaction, and write "slow" next to the rate-determining step. Be sure to draw all intermediates, and to correctly draw "electron-movement" arrows or half-arrows. (Show the propagation steps only.) (4 points)

2. Draw the mechanism for the following reaction, and write "slow" above the rate-determining step. Be sure to draw all intermediates, and to correctly draw "electron-movement" arrows. (5 points)

3. Predict the major products for the following reactions. (4 points each)

4. Draw the substitution products for the following reactions. (Do not draw the accompanying elimination products). Include stereochemistry in your answer, and if two substitution products are formed draw them both. (4 points each)

5. Draw the E2 elimination product(s) [do not draw the substitution product(s)]. (4 points each)

6. Of the following alkyl halides, (3 points)

- a) Circle the one that would be the most reactive toward $\text{S}_{\text{N}}2$ substitution
b) Put a box around the one that would be the least reactive toward $\text{S}_{\text{N}}2$ substitution

7. Of the following alkyl halides, (3 points)

c) Circle the one that would be the most reactive toward S_N1 substitution

d) Put a box around the one that would be the least reactive toward S_N1 substitution

8. Rank the stability of the following carbocations, from 1 (most stable) to 4 (least stable) (4 pts)

9. Rank the stability of the following radicals, from 1 (most stable) to 4 (least stable) (4 pts)

10. Classify as R or S (2 pts each)

S

R

achiral, no R or S

S

11. Provide the structure and the IUPAC name for the following (3 pts each)

a) (R)-3-chloro-2-methylheptane

(R)-1-bromo-3-methylpentane

12. Classify the pairs of molecules as not isomers, structural isomers, diastereomers, enantiomers, or identical, and circle any molecules that are achiral. (2 pts each)

same (achiral)

enantiomers

enantiomers

13. For 1,2-dimethylcyclopentane, (8 pts)

a) How many stereocenters are present

2

b) Draw all the possible stereoisomers, and circle those that are chiral.

Each of the following multiple choice problems is worth 3 points.

14. For the reaction shown below, with bond dissociation energies listed below each key bond, the overall ΔH is:

- a) +58 kcal/mol
- ☒ b) -32 kcal/mol
- c) +32 kcal/mol
- d) -57 kcal/mol
- e) +181 kcal/mol

15. Which factor would not increase the rate of an E1 reaction:

- a) Use of a more polar solvent
- b) Use of a 3° rather than a 2° alkyl halide
- ☒ c) Doubling the concentration of the base
- d) Using iodide rather than bromide as leaving group

16. Consider the $\text{S}_\text{N}2$ reaction shown below. Assuming no other changes, what effect on the rate would simultaneously doubling the concentrations of both 1-bromobutane and KOH have?

- a) No effect
- b) It would double the rate
- c) It would triple the rate
- ☒ d) It would increase the rate by four times
- e) It would increase the rate six times

17. Of the $\text{S}_\text{N}1/\text{S}_\text{N}2/\text{E}1/\text{E}2$ reactions, rearrangements are likely to occur in:

- a) $\text{S}_\text{N}1$ reactions only
- b) $\text{S}_\text{N}2$ reactions only
- c) E1 reactions only
- ☒ d) Both $\text{S}_\text{N}1$ and E1 reactions
- e) Both $\text{S}_\text{N}2$ and E2 reactions

JASPERSE CHEM 350 TEST 3
Ch. 7 Structure and Synthesis of Alkenes
Ch. 8 Reactions of Alkenes

VERSION 1

1. How many elements of unsaturation are in the formula $C_6H_9NO_2$? (3 points)

- a. 0 b. 1 c. 2 **d. 3** e. 4 f. 5 g. 6

$$(14+1) - 9 = 6H$$

2. For the three structures shown, which of the statements is true? (3 points)

- a. A, C, and D are Z; B is E
b. A and B are the only Z compounds
c. A is the only Z compound; B is the only E compound
d. B, C, and D are Z; A is E
e. B is the only Z compound; A is the only E compound

3. Rank the reactivity of the following toward H_2SO_4/\hat{I} catalyzed dehydration. (3 points)

- a. **A** is fastest; **C** is slowest
b. **B** is fastest; **C** is slowest
c. **A** is fastest; **B** is slowest
d. **C** is fastest; **B** is slowest
e. **B** is fastest; **A** is slowest
f. C is fastest; A is slowest

4. Which of the following reactants would give exactly the same products from both (E)- and (Z)-2-butene? (3 points)

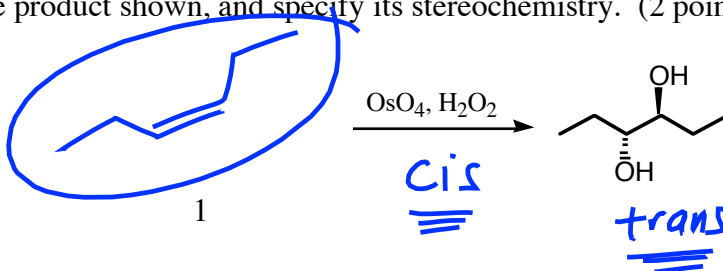

If two chiral centers are produced, then diastereomeric products are produced.

- a. Br_2
b. $PhCO_3H$
c. 1) BH_3 -THF 2) $NaOH, H_2O_2$
d. OsO_4, H_2O_2
e. D_2, Pt

But if only one (or zero) chiral centers are produced, then the two alkenes don't give different products. In this case, with H-OH being added, only the carbon to which OH is added ends up being chiral, so you get the same racemic mix of 2-butanol either way.

5. Draw the alkene that gives the product shown, and specify its stereochemistry. (2 points)

The normal "E" alkene would have given the wrong product stereochemistry. If the cis/trans sense of the addition and the cis/trans appearance of the product match, then "E" alkene would have worked.

6. Draw the **major** product for each of the following reactions or reaction sequences. You needn't bother to show side products or minor products. For chiral molecules that are racemic, you needn't draw both enantiomers. BE CAREFUL TO SHOW THE CORRECT ORIENTATION, AND THE CORRECT STEREOCHEMISTRY IN CASES WHERE STEREOCHEM IS FACTOR. (3 points each)

\Rightarrow 2 chiral C's

7. A single unknown reacts with O_3/Me_2S to give the following three products. What is the structure for the unknown? (3 points)

8. Provide the name or structure for the following. (3 points each)

9. Provide a possible structure for a compound with formula C_5H_8 , given that it reacts with excess H_2/Pt to give C_5H_{10} . (3 points)

10. Fill in the blanks for the following reaction sequence: (6 points)

11. Consider how the Se-O bond would be polarized and predict the product which would result when CH_3SeOH adds to propene: (Selenium is located two rows directly below oxygen on the periodic table). (3 points)

12. When the following isomeric alkenes are fully burned, rank the amount of heat produced in the combustions, from most heat produced (1) to least heat produced (4). (3 points)

13. Provide structures for starting material **A** and reactions products **B** and **C**, given the formula of starting material **A** and the stereochemical status of products **B** and **C**. (5 points)

14. Draw mechanisms for the following reactions, using formal arrow-pushing. Each intermediate along the mechanism pathway must be shown. (6 points, 3 points, 6 points)

15. Provide reagents for the following transformations. (5 points each)

JASPERSE CHEM 350 TEST 3
Ch. 7 Structure and Synthesis of Alkenes
Ch. 8 Reactions of Alkenes

VERSION 2

1. How many elements of unsaturation are in the formula C_8H_9N ?

- a. 0
- b. 1
- c. 2
- d. 3
- e. 4
- f. 5

$$(18+1) - 9 = 10H$$

2. Provide the proper IUPAC name for the alkene shown below.

6-bromo-1-methylcyclohexene

3. Provide the proper IUPAC name for the alkene shown below.

(Z)-5-chloropent-2-ene
or cis
or (Z)-5-chloro-2-pentene

4. Draw an acceptable structure for 4-phenyl-1-butene.

5. Draw the alkene of formula C_4H_8 which evolves the most heat per mole upon hydrogenation

↳ least stable

6. Choose the most stable alkene among the following.

a. 1-hexene

b. (E)-2-hexene

c. (Z)-2-hexene

d. They are all of equal stability according to Saytzeff's rule.

7. Draw the major product of the following reaction.

8. Draw the major product and the mechanism.

9. Which of the following best describes the geometry about the carbon-carbon double bond in the alkene below?

- a. E
- b. Z
- c. Neither E nor Z

10. Draw 3 examples of molecules with the formula $\text{C}_4\text{H}_6\text{O}_2$

11. Draw the major product.

12. Draw the major product.

13. Draw the major product.

14. Draw the major product.

15. Draw the major product.

16. Draw the major product.

17. Complete the following reaction and provide a detailed, step-by-step mechanism for the process.

18. Suggest a reasonable detailed, step-by-step mechanism for the reaction shown below.

19. Provide the reagents necessary to complete the following transformation. (2 steps minimum).

20. Both (E)- and (Z)-3-hexene can be treated with D_2 in the presence of a platinum catalyst. How are the products from these two reactions related to each other?

- The (E)- and (Z)-isomers generate the same products in exactly the same amounts.
- The (E)- and (Z)-isomers generate the same products but in differing amounts.
- ☒ The products of the two isomers are related as diastereomers.
- The products of the two isomers are related as enantiomers.
- The products of the two isomers are related as structural isomers.

21. Consider how the I-Cl bond is polarized and predict the product which results when this mixed halogen adds to 1-methylcyclohexene.

22. β -Ocimene is a perfume. Suggest a possible structure for β -ocimene that is consistent with the following information.

23. Fill in the starting reactant.

24. Fill in the blanks for the following reaction sequence.

25. Provide reagents to carry out the following transformation: (3 steps minimum)

or $\text{KOC}(\text{CH}_3)_3$

JASPERSE CHEM 350 **TEST 3**
 Ch. 7 Structure and Synthesis of Alkenes
 Ch. 8 Reactions of Alkene

VERSION 3

Answers

The number of points per problem is indicated in parentheses following each problem.

1. Rank the following alkenes in order of stability, 1 being most stable, 4 being least stable. (4)

2. Determine the number of elements of unsaturation for C_5H_7ClO . (3)

$EU = 2$

Theory: 12 H + halogen
 Actual: 8 H + Cl

Halogen is equivalent to a hydrogen, both use up one single-bond.

$4 \text{ short} \div 2 = 2 \text{ EU}$

3. Give the proper IUPAC name or the structure for the following compounds. (4 points each)

- a. (E)-2-chloro-3-methyl-2-pentene

Cl > CH₃ on left alkene carbon

b.

(Z)-5-methyloct-2-ene
 or cis-

4. Rank the reactivity of the following alcohols towards HBr, 1 being the fastest reactant, 3 being the slowest reactant. (3 points)

3

2

1

Cation stability following protonation (such that the best possible cation can form.)

5. Predict the major product for the following reactions. You needn't bother to show any side products or minor products. Pay careful attention to orientation. (3 points each)

6. Predict the major product in each of the following reactions. Pay careful attention to stereochemistry! (3 points each)

Note: For chiral products, I'm just drawing one of the two enantiomers. Either is fine. Understand that if chiral, both enantiomers will form.

7. Fill in the starting reactant. (4 points each)

or

Z, not E alkene.

The mechanism of addition is trans, so to result in the "cis look" of the product as drawn, a bond rotation was required.

The product-look and the mechanism of addition are mismatched.

8. Provide the major product of the following reaction sequences. (4 points each)

9. What is a possible structure for a molecule A given the following: (6 points)

a. is has the formula C_6H_{10}

$EU=2$

b. it reacts with H_2/Pt to give a product with formula C_6H_{12}

1 Alkene

c. upon ozonolysis (O_3 ; Me_2S) it gives two products, $CH_2=O$ and a product C_5H_8O .

Must have an alkene with $=CH_2$ on end

etc

Many answers possible.

But, must have the following:

1. One alkene

2. One ring

3. An alkene with CH_2 on end

10. Fill in the boxes. (6 points total)

11. Provide reagents to accomplish the following transformations. (6 points each)

12. Draw the mechanisms for the following reactions. Be sure to draw all intermediates, and try to correctly draw "electron-movement" arrows. (8 points for the first, 6 points for the second)

3 steps:

1. Protonation
2. Loss of neutral water
3. Deprotonation

Note: identify of agent who grabs the H in step 3
Could be water or HSO_4^- anion. I don't need that to be specified.

13. Draw as many isomers as you can for alkenes with formula C_5H_{10} . (8 points. 2 points off for each duplicate or each possible isomer not drawn.)

EU = 1.

Problem wording specifies "alkene"

JASPERSE CHEM 350 TEST 3
 Ch. 7 Structure and Synthesis of Alkenes
 Ch. 8 Reactions of Alkenes

VERSION 4

Answers

1. Rank the following alkenes in order of stability, 1 being most stable, 4 being least stable. (3 points)

Tri-subbed > di > mono
 Trans > cis

2. Determine the number of elements of unsaturation for C_5H_8O . (2 points)

2

3. Give the proper IUPAC name or the structure for the following compounds. (3 points each)

a. 4-vinylcyclopentene

b.

(E)-5-propyloct-2-ene
 Or trans-

4. Rank the reactivity of the following alcohols towards H_2SO_4/Δ catalyzed dehydration, 1 being the fastest reactant, 3 being the slowest reactant. (3 points)

Cation Stability
 Explains

5. Which of the following statements is true for the structures shown: (3 points)

- a. **A** is Z and **B** is Z
- b. **A** is Z and **B** is E
- c. **A** is E and **B** is Z
- d. **A** is E and **B** is E

6. Predict the major product for the following reactions. You needn't bother to show any side products or minor products. Pay careful attention to orientation, which is important in many of these problems. (3 points each)

7. Predict the major product in each of the following reactions. Pay careful attention to stereochemistry: stereochemistry is involved in each of these problems! (3 points each)

Note: For chiral products I just drew one of the two enantiomers. Either is fine. You should be aware that both form, but as time-saver we usually only draw one

8. Fill in the intermediates in the following transformation. (3 points each)

9. For the following reactions, fill in the missing starting materials, reagents, or products. (3 points each)

10. Provide the major product of the following reaction sequences. (4 points each)

11. Provide reagents to accomplish the following transformations. (4 points each)

Either alkene could hydrogenate to the product shown. So, whether you use a bulky base or a normal base, doesn't really matter.

12. Provide the product for the following reaction. Be sure to show the stereochemistry of the product. (3 points)

Very trick one! Notes:

1. 3° R-Br required E2, not SN2.
2. But, E2 requires a trans H.
3. In the original figure, the H is cis, not trans.
4. Bond rotation can happen to spin the H into the trans position, enabling E2 elimination and leading to the resulting stereochemistry.

13. Draw the mechanism for the following reaction, and write "slow" next to the rate determining step. Be sure to draw all intermediates, and to correctly draw "electron-movement" arrows or half-arrows. (4 points)

Note: my answer doesn't specify who actually grabs the H in the final deprotonation step. One could imagine HSO₄⁻ anion doing that, to regenerate catalytic H₂SO₄. Probably water does. I won't be points-picky on this, so long as you show an H coming off from adjacent carbon.

14. Draw the mechanism for the following reaction. Be sure to draw all intermediates, and to correctly draw "electron-movement" arrows or half-arrows. (4 points)

In practice, the bromide does attack the more substituted carbon of the bromonium ion ring, because the more substituted carbon has more partial-positive charge on it.

15. Formula: C₄H₈

Reactivity: reacts with H₂/Pt to give C₄H₁₀

DRAW ALL POSSIBLE ISOMERS, INCLUDING STEREOISOMERS. (4 isomers are possible!) (5 points)

JASPERSE CHEM 350 TEST 4 VERSION 1
Conjugation, Diels-Alder, Aromaticity, Aromatic Reactions

1. Provide the Name or Structure for the Following (7 points)

pyridine

m-nitroaniline

O-bromotoluene
or 2-
or ortho-

2. Circle the aromatic molecules (6 points)

3. For each nitrogen in the molecule, classify the hybridization of the nitrogen atom, the hybridization of the nitrogen lone pair, and classify whether the basicity of the nitrogen is "normal" or "low". (5 points)

	Nitrogen Hybridization	Lone-Pair Hybridization	Nitrogen Basicity
N _a	sp ²	sp ²	normal
N _b	sp ²	p	low
N _c	sp ²	p	low
N _d	sp ³	sp ³	normal

4. Bromide **B** has normal reactivity (for a 2° bromide) toward S_N1 substitution, but **A** has much higher reactivity and **C** has much lower reactivity. a) Why is **A** more reactive toward S_N1? b) Why is **C** much less reactive toward S_N1? (4 points)

allylic
stabilized

5. Synthesis Reactions. Draw the feature product of the following reactions (need not show any byproducts). (21 points, 3 points each)

6. Design sequences for the designated conversions. (5 points each)

7. Design a synthesis for the following molecule beginning with toluene. (6 points)

8. Draw the Reactants for the following (3 points)

9. a) Draw the major product for the following reaction, and b) draw the mechanism for its formation. c) Identify the slow step. d) Draw all the resonance structures for the cation intermediate. (7 points)

10. (9 points total) a) Draw the mechanism for the following reaction, in which a common intermediate gives rise to both products.

b) In the above reaction, is product A chiral or achiral? A is chiral (but would be racemic)

c) Which is the “thermodynamic” product (more stable, which builds up under equilibrating conditions)? B is the thermodynamic product, due to both higher substitution (di-substituted versus mono-substituted) and also due to conjugation with the phenyl

d) You probably already did this, but either re-draw or identify the two key resonance structures for the intermediate in the mechanism above. (You can just circle the two of them, assuming you already sketched them above.).

11. Rank the following, with 1 being highest/most. (2 points each)

More stable, less heat.
Conjugated more stable than isolated
Higher substitution increases stability.

Cyclopentadiene is always "s-cis"
Z-substituent retards reactivity

Allylic accelerates S_N2
 S_N2 can't do vinyl/aryl

Aromatic stability makes it less reactive reactant. (Reactant stability/ reactivity principle.)

JASPERSE CHEM 350 TEST 4 VERSION 2
 Conjugation, Aromatic Compounds, Reactions of Aromatic Compounds

1. Provide the Name of Structure for the following. (7 points)

a. 3-nitroaniline

b. o-isopropyltoluene

c.

Pyrrole

2. Circle the aromatic molecules. (7 points)

8 π electrons

acyclic

3. The molecule has 3 different nitrogens. For each of them, classify the hybridization of the nitrogen atom, the hybridization of the nitrogen lone pair, and whether the basicity of the nitrogen is "normal" or "low". (6 points)

	Nitrogen Hybridization	Lone-Pair Hybridization	Nitrogen Basicity
N ^a	sp^2	p	low
N ^b	sp^3	sp^3	normal
N ^c	sp^2	sp^2	normal

4. Draw the major products of the following reaction (4 points).

5. Draw the Major Product of the Following Reactions. Note: I want one major product in each case. (3 points each)

Note: This answer key is showing intermediates along the pathway for multi-step reactions, so it's easier for students to see how the final product was formed. But for test grading, all I would need is the final product.

1. Radical bromination on allylic spot
2. Hydroxide does $\text{S}_\text{N}2 \gg \text{E}2$.
-Small nucleophile, and $\text{S}_\text{N}2$ is greatly accelerated by being allylic

Note: Either of two structural isomers is acceptable as answer. First actually predominates, but that wasn't covered in class.

6. Rank the following, with 1 being highest/most. (2 points each)

Reactivity toward
 Br_2 , FeBr_3

Strong donor/activator > weak donor/activator > withdrawer/deactivator

Heat of
hydrogenation

More stable => less heat.
1. Conjugation.
2. Substitution level.

Stability

1. Conjugated vs isolated.
2. Ring strain

Combined
Diels-Alder
Reactivity

1. Cyclopentadiene is always s-cis
2. Electron withdrawing group activates dienophile

Cation
Stability

1. NH_2 is a strong cation stabilizer
2. NO_2 is a strong cation de-stabilizer

Reactivity
toward NaOMe

For $\text{S}_{\text{N}}2$,
1. vinyl/aryl is bad.
2. Allylic accelerates

8. Treatment of an alkyl halide with methanolic AgNO_3 often promotes ionization, via the following:

When 3-bromo-1-butene undergoes this reaction, two isomeric products **A** and **B** are formed. Draw the structure for product **B** and the detailed mechanism for formation of product **B**. (7 pts)

SN1 mechanism, but since it passes through an asymmetric allylic cation, the second product is available via the second resonance structure.

9. Draw the product for the following reaction and draw the mechanism for its formation. Identify the slow step. Draw all the resonance structures for the cation intermediate and circle the most important contributor. (7 points)

10. (3 pt) When comparing cyclopentadiene (**A**) versus 1,3-pentadiene ($\text{CH}_2=\text{CH}-\text{CH}=\text{CH}-\text{CH}_3$, **B**), one is much more acidic. Circle the more acidic chemical, and explain why it is much more acidic.

Since acidity involves donating a proton and getting one charge unit more negative, any neutral acid will create an anion. The cyclopentadiene anion is aromatic.

11. Draw the Reactants for the Following Reactions (6 points)

12. Provide reagents for the following transformations. (5 points each)

Notes:
1. For 1° alkyl, need to go in via acyl group. 1° alkyl cations have problems.
2. Sequence: must be as shown. The acyl group (carbonyl) is a meta director.

Sequence must be as shown.
Need o/p-directing Br first, prior to the meta-directing NO_2 . And need the sulfonation to block the para position, otherwise nitro would mostly go para not ortho.

JASPERSE CHEM 350 TEST 4 VERSION 3
 Conjugation, Aromaticity, Electrophilic Aromatic Substitution

1. Provide Either the Name or the Structure for the Following Chemicals. (6 points) (3 minutes)

a. Furan

b. p-nitrobenzoic acid

3-ethylaniline
 Or m-ethylaniline
 Or meta-ethylaniline

2. For the following substituents, classify each as 1) electron-donating or electron-withdrawing ["D" or "W"], 2) as activating or deactivating ["Act" or "Deact"], and as 3) ortho-para directing or meta directing ["o/p" or "m"]. (6 points) (2 minutes)

	$-\text{OCH}_3$	$-\text{C}(=\text{O})\text{CH}_2\text{CH}_3$	$-\text{CH}_3$	$-\text{Cl}$
1. D or W	D	W	D	W
2. Act or Deact	Act	Deact	Act	Deact
3. o/p or m	o/p	m	o/p	o/p

3. The molecule below has 3 different nitrogens. For each of the nitrogens, classify the hybridization of the nitrogen atom, the hybridization of the nitrogen's lone pair, and whether the basicity of the nitrogen is "normal" or "low". (6 points, 2 min)

	Lone-Pair Hybridization	
N ^a	sp ²	Double bonded
N ^b	p	Conjugated
N ^c	sp ³	Isolated

4. Rank the reactivity (rates!) of the following sets of molecules toward the reagents shown, 1 being most reactive, 2 being middle, and 3 being least reactive. (10 points) (6 minutes)

Reagent	Molecules Being Compared		
a. H_2, Pt	 3 Aromatic, most stable	 1 Isolated, least stable	 2 Conjugated
b. $\text{H}^+, \text{H}_2\text{O}$ ($\text{S}_{\text{N}}1/\text{E}1$)	 1 Allylic cation best	 2 2° cation	 3 1° cation worst
c.	 3 Never s-cis	 1 Always s-cis	 2
d. $\text{HNO}_3, \text{H}_2\text{SO}_4$	 3 deactivator	 2	 1 Activator
f. NaOMe ($\text{S}_{\text{N}}2$ reactivity)	 1 Allylic, fast	 2 1° > 2° for $\text{S}_{\text{N}}2$	 3

5. Draw the major product for each of the following reactions. (3 points each, 21 total, 7 minutes)

While both substituents are o/p directors, the oxygen group is much stronger activator and dictates position.

Br₂ with Lewis acid adds to the ring. But under radical conditions, radical bromination occurs on the benzylic site. SN₂ beats E₂ because being allylic/benzylic greatly activates SN₂, plus methoxide is pretty small.

Nitro deactivates the left ring, so the methyl-activated right ring wins.

Many allylic brominations give isomers. In this case, both allylic positions are symmetry equivalent, and the allylic radical is also symmetric.

6. Provide reagents for the following transformations. (5 points each, 10 total, 6 minutes)

Note: Methyl is an o/p director, carboxylic acid is a meta director. So, you wanted to install the Cl ortho prior to converting the methyl to carboxyl. But direct chlorination would have come in predominantly para, *IF* the para position was not blocked. Thus the use of sulfonation to block the para position.

Notes: Direct install of 1° alkyl is problem, due to both instability of 1° carbocations and carbocation rearrangement. So, you need to install the carbon as the carbonyl, and convert it later. When the second group gets added, the first must be a meta director. Nitro could have gone in first.

7. Draw the diene and dienophile from which the following Diels-Alder products would have come. (3 points each, 6 total, 2 minutes)

8. a. Draw the mechanism for the formation of the major product shown, and identify the "slow" step in the reaction. (6 points, 5 minutes).
 b. Also draw all 4 resonance structures for the cation intermediate in the reaction. (4 points)

10. Circle the aromatic molecules: (6 points) (3 minutes)

9. Draw the major product or products that would result from the following reaction, and write either "chiral" or "achiral" and "optically active" or "racemic" by each product. Draw a mechanism for the reaction, and identify the "slow" step in the reaction. (8 points, 5 min)

9. Provide a synthesis for the following molecule, starting from benzene and anything else you like. (7 points, 5 min)

JASPERSE CHEM 350 FINAL EXAM
150 points total

VERSION 1

1. Provide names or structures for the following. 2 points each. Specify stereochemistry when appropriate!

Note: Version 1 is relatively representative in terms of length. Version 2 is longer than the real test will be. But provides lots more practice.

m-isopropylphenol

2. Identify the functional groups in the following molecule. (4 points)

3. Predict the major products for the following reactions. Pay careful attention when orientation is a factor. Draw just one major product in each case. (3 points each)

4. Classify the pairs of molecules as totally different, identical, structural isomers, diastereomers, or enantiomers. (2 points each)

enantiomers

structural isomers

identical

enantiomers

5. Classify each chiral carbon as R or S. (2 points each)

R

R

6. Classify the hybridization and bond angles (109, 120, or 180) at the labelled atoms. (5 points)

C-1 sp^2
120

C-2 sp^3
109

C-3 sp^2
120

O-4 sp^3
109

7. Draw the mechanisms for the following reactions. For any radical reactions, draw propagation steps only. 5 points each.

8. Draw the products of the following multi-step sequences. (4 points each)

9. Draw as many structural isomers as you can for C_6H_{14} . Circle any that are chiral. (Note: be careful! You will lose points for any repeats!) (6 points)

C_6H_{14} $\text{EU} = 0$ no rings or alkenes

None are chiral

10. Rank the Following, from most to least. 2 points each.

a. Reactivity toward S_N2

$I > Br > Cl$
 $1^\circ > 2^\circ$

b. Stability

① allylic > isolated ② $3^\circ > 2^\circ > 1^\circ$

c. Stability

1. Equatorial preferred
 2. If forces to be axial, worse for big group than for smaller group

d. Acidity

1. Anion stability
 2. HCl by memory is strong
 3. Electronegativity factor
 4. Resonance factor

e. Stability

1. staggered vs eclipsed
 2. Anti > gauche
 3. Eclipsed > total eclipsed

f. Reactivity toward H_2SO_4/Δ catalyzed dehydration

Cation stability is key

g. Boiling Point

1. Hydrogen bonding
 2. Molecular weight factor

11. Provide reagents for the following transformations. You may use anything you like. Each can be done within ≤ 3 steps. (4 points each)

12. Provide the appropriate reactant for the following transformation. (3 points)

13. Suggest a structure for **X**, given the following info: (5 points)

- Formula: C_8H_{12}
- It Reacts With excess H_2/Pt to produce C_8H_{16}
- When it reacts with O_3/Me_2S , one of the products is $CH_2=O$.

Theory =
Actual = 12
Eu = 3

18

→ 2 alkenes
=CH₂ 1 ring

1 ring
2 alkenes
1 of the alkenes is on an end, =CH₂

14. Which of the following are aromatic

15. Draw the products and mechanism for the following reaction:

Protonation gives asymmetric allylic cation, leading to two isomers. Protonation on left end would have given an inferior allylic cation

16. Rank the following:

② Diene-wise

(always s-cis)

① Dienophile-wise better, two w groups

Combined S_N2 Reactivity

Note: Good for practice, but significantly longer than the real one will be.

1. Rank the Following, from most to least. 2 points each.

a. Stability

b. Stability

allylic > isolate $3^\circ > 2^\circ > 1^\circ$

c. Stability

d. Acidity

e. Stability

f. Reactivity toward HBr

R^+
stability

g. Reactivity toward $Br_2/h\nu$

R^\bullet

h. Reactivity toward S_N2 

i. Boiling Point

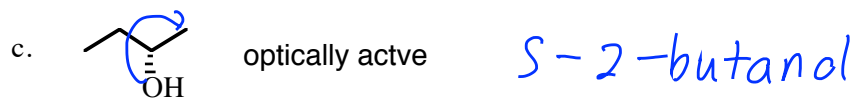

j. Stability

2. Provide names or structures for the following. 3 points each. Note: don't forget to specify stereochemistry!

3. Classify the pairs of molecules as totally different, identical, structural isomers, diastereomers, or enantiomers. (2 points each)

3. (continued) Classify the pairs of molecules as totally different, identical, structural isomers, diastereomers, or enantiomers. (2 points each)

4. Draw at least four different isomers for C_5H_{10} . (There are lots more than four...) (6 points)

$\rightarrow EU=1$ ring or alkene

5. (a) Draw the appropriate number of lone pairs on the oxygen atom,
 (b) Assign a formal charge on oxygen if appropriate,
 (c) Draw an additional resonance structure for the following, and
 (d) Identify which of the two structures would make the greater contribution to the hybrid. (4 points)

6. Draw resonance structures for each of the following:.

7. Identify the functional groups in the following molecule. (4 points)

8. Classify the hybridization and bond angles (109, 120, or 180) at the labelled atoms. (4 points)

C-1 sp^3
109

O-2 sp^3
109

C-3 sp^2
120

9. Draw both chair conformations of trans-1-methyl-3-isopropylcyclohexane, and circle the more stable one. (5 points.)

Note 1: It will simplify things if you abbreviate the isopropyl group as "R".

Note 2: Make sure that your second chair has the same "configuration" as the first, and is not an enantiomer.

10. Classify each chiral carbon as R or S. (Some structures may have more than one chiral carbon!) (2 points each)

11. Mechanisms Problem. Draw the mechanism for the following reactions, and write "slow" next to the rate-determining step. Be sure to draw all intermediates, and to correctly draw "electron-movement" arrows or half-arrows. For radical reactions, draw propagation steps only. 4 points each.

Mechs, continued

12. Predict the major products for the following reactions. In each case, pay careful attention to orientation and stereochemistry. Draw just one product in each case. (3 points each)

13. Draw the substitution products for the following reactions. (Do not draw any accompanying elimination products.) Include stereochemistry in your answer, and if two substitution products are formed, draw them both. Assume the starting material is optically active as drawn. (3 points each)

14. Draw the products of the following multi-step sequences. (4 points each)

15. Provide reagents for the following transformations. More than one step is needed in each case. (4 points each)

16. Provide the appropriate reactant for the following transformation. (3 points)

17. Suggest a structure for **A** that is consistent with the following information. (There is more than one possible solution, but you only need to provide one.) (5 points)

$\text{EU}=2$
 1 ring
 1 alkene
 (based on both hydrogenation + ozonolysis)

18. Draw the products for the following reactions:

Flawed problem.
Not clear which
allylic cation you
should use.

Protonation on the
left gives allylic
where both +
carbons are 2°;
protonation on the
right gives a hybrid
of a 3°/1° cation.

19. Which of the following are aromatic

20. Classify the lone pair hybridization on the three nitrogen atoms in the following molecule:

21. Draw the major products and mechanism for the following reaction:

Protonation occurs on the left-most carbon, because that gives by far the best cation. 3° allylic and conjugated to the phenyl as well. The asymmetric allylic cation gives two different products (1,2 and 1,4 addition).

22. Draw the major product and mechanism for the following reaction. Draw all of the resonance structures for the key carbocationic intermediate

23. Design a synthesis for the following:

24. Explain why **A** is more acidic than **B**, but **C** is less reactive than **D** towards $\text{S}_{\text{N}}1$ reactivity

25. Rank the following
