

First, read the paragraph in the problem section of the textbook about the logical operators NAND and NOR and practice with the NAND operator (problems 46, 47, 52, 53, 54). Then do the following problems.

(a) Use a truth table to verify each of the following.

(i) $\neg p = p \mid p$

(ii) $p \vee q = (p \mid p) \mid (q \mid q)$

(b) Write $p \wedge q$ in terms of *NAND* alone, and verify with a truth table.

(c) Use the known relations between the standard five logical symbols and part (a) to write each of the following in terms of *NAND* (that is, \mid) alone.

(i) $p \rightarrow q$

(ii) $p \leftrightarrow q$

(d) Rewrite $p \wedge (q \rightarrow \neg r)$ in terms of just *NAND*.
