

1. Predict the ^1H NMR spectrum. Include the approximate chemical shifts (1's, 2's, etc.), the integration, and the splitting (can use "s" for singlet; "d" for doublet; "t" for triplet; "q" for quartet; and "m" for multiplet, anything more complex than a quartet). Note: for signals that are symmetry equivalent, do not list them twice.

1's	6H	d
2's	1H	m (septet)
3's	2H	t
1's	2 H	pentet
1's	2H	sextet
1's	3+	+

2. Predict the ^{13}C NMR spectrum. Include the approximate chemical shifts (220-160, 160-100, 100-50, or 50-0) and the splitting if a couple carbon was taken (q, t, d, s).

50-0	q
220-160	s
140-100	d
100-100	d
50-0	t
100-50	d
50-0	q

3. Match the following structures with the listed feature IR signals:

1) 3300-3200

(D)

2) 3300-2500, 1680

(C)

3) 2200

(A)

4) 1720

(B)

Solve the structures for the following. If you get a structure perfect, you will get full credit. If you do not get a structure perfect, you may still get some partial credit. Thus, it is in your interest to show some of your work, make a structure guess, or tell me what you do know for sure.

IR: 1670

^{13}C NMR: 210 (s, short), 150 (s, short), 130 (d, tall) 124 (d, tall), 120 (d), 33 (t), 26 (t), 20 (q)

$E.U = 5 \Rightarrow$ aromatic + $C=O$
 $C=O$ conjugated (IR)
